

One case, start to finish

Six steps. Only the last one supplies the fill confirmation.

1**Doctor signs**

A fictional prescription starts the case.

**2****Pharmacy reports a barrier**

The operator supplies this outside event.

**3****Gemini reads; a rule routes**

The reason becomes an allowed next action.

**4****Doctor hands off; staff sends**

A human coordinator owns the follow-up.

**5****Patient taps the card**

Acknowledgment only. Still pending.

**6****Pharmacy confirms dispensing**

Separate simulated input → Fill confirmed.

SAY IT SIMPLY

The patient tap is not a fill. Even a confirmed fill does not prove a dose.

Fictional patients and pharmacy events. Partner integrations are concepts. Source main 015c342 • Sep 27, 2026.

Behind one click

The server saves accepted events; screens and outputs follow that saved state.

SAY IT SIMPLY

One shared notebook. Screens normally read it about every 1.5 seconds.

AI has one small job

Gemini labels the problem. It does not choose treatment or execute the fix.

Messy pharmacy / hub note

Example: the fictional price-related barrier in Maria's case.

Gemini

Read note → propose an allowed reason

Strict validation

Accept allowed code or leave it unknown

Unknown / failure

Human fallback; do not invent the expected answer

Deterministic rule

Reason + coverage + eligibility → administrative action

No numeric confidence threshold. A valid code can still be wrong.

Human coordinator

Reviews and sends the permitted action

SAY IT SIMPLY

AI reads the note. A rule picks the fix. A human taps send.

Two databases, two jobs

Operational details and outcome measurements serve different purposes.

Supabase = notebook

What happened in the practice workflow?

Workflow events

Orders, handoffs and actions

Practice state

Links, messages and alert intents

FILTER + KEYED CASE FINGERPRINT

Tiger Data = scoreboard

Selected prescription, reason and dispensing events

Kept for metrics

Time, event identity, case hash, kind and allowed reason

Left out

Raw names, notes, drug, insurance and prices

SAY IT SIMPLY

Tiger stores pseudonymous events. The Market Access screen shows aggregates.

What counts as success?

Three different observations. Keep them separate in your explanation.

1 Card acknowledged

The patient pressed Use at pharmacy.

FILL COUNT CHANGE: 0

2 Pharmacy confirms fill

Separate operator event represents dispensing.

FILL COUNT CHANGE: +1

Cannot infer a dose

3 Patient takes a dose

Not established by either action above.

DOSE / CLINICAL BENEFIT: NOT MEASURED

SAY IT SIMPLY

Eight seeded fills + Maria's confirmation = nine demo fills. Not nine proven treatment successes.

The watch is the doorbell

A missed notification must not erase the saved case.

Saved workflow

Supabase commits the event and alert intent.

Notification worker

Claims the intent and sends prepared text.

ntfy → paired phone

The service accepts a notification request.

Watch receipt

Depends on actual delivery, pairing and settings.

Server accepted it ≠ the wrist received it.

SAY IT SIMPLY

Show the watch only if it buzzed. Otherwise show the actual phone alert.

Approval is not identity proof

Know this distinction if a judge asks about NPI or coordinator access.

NPI format check

Is the provider identifier structurally valid?

VALID FORMAT DOES NOT PROVE WHO IS USING IT

Coordinator request

Staff asks to receive a prescriber's follow-up tasks.

Doctor approval

Records the permitted handoff in this demo.

Today: simulated accounts

Fictional identities and a shared demo login. No production identity verification claim.

Production needs

Separate authenticated identities and enforced practice permissions.

SAY IT SIMPLY

We check the NPI's format. We do not verify the person's identity.

Your stack and three tracks

Name the tool when you show its job. Avoid a long list during the pitch.

Screens + server

React + Next.js + TypeScript, hosted on Vercel

Reference + delivery

DailyMed/RxNorm labels • ntfy alerts • prepared ElevenLabs audio

Oracle of the Deep

Bounded Gemini classification + understandable outcome analytics

Impiricus

Useful doctor alerts → coordinator ownership → tracked confirmation

SpaceXAI

Grok transcribes a handoff → human checks → explicit confirmation

SAY IT SIMPLY

Your short script omits voice. Keep it ready for SpaceXAI questions on an eligible case.

Your demo in six short cues

Khadim opens. You run Maria. Minh supplies pharmacy events. Khadim holds the patient phone.

QUEUE

“Three need a fix, two are waiting, eight are filled.”

SIGN

“Sending is not filling. Here is the verified label.”

REASON + HANDOFF

“Gemini reads. A rule routes. The doctor hands off.”

PATIENT TAP

“That is acknowledgment, not a fill.” Pause.

PHARMACY CONFIRMS

“Now it says Fill confirmed.” Check the actual alert.

MARKET ACCESS

“Eight plus Maria gives nine.” Check the source badge.

SAY IT SIMPLY

Never cut the acknowledgment pause. Read the actual screen, not an expected success.

Eight questions to know cold

Answer in one or two sentences. Add detail only if the judge asks.

What did you build?

Barrier → owned staff task → independent confirmation.

Is the pharmacy real?

No. Operator inputs simulate the external feed.

Does AI pick the fix?

No. It names the reason; rules and humans control action.

Why two databases?

Supabase runs the workflow; Tiger measures selected outcomes.

What does nine mean?

Eight seeded fills plus Maria's confirmation. Demo data.

Do you verify NPIs?

Format/checksum only. That is not identity verification.

Why is James still stuck?

A support request is not pharmacy confirmation.

What did you save?

No measured savings yet. A real pilot must establish them.

SAY IT SIMPLY

Gemini reads. Rules route. Humans approve. Supabase remembers. Tiger measures.
